

Essential Question 4/15/2021

How can I use exponential functions to solve compound interest problems?

Standard:

MGSE9-12.A.CED.2

Create exponential equations in two or more variables to represent relationships between quantities. (The phrase "in two or more variables" refers to formulas like the compound interest formula, in which $A = P(1 + r/n)^{nt}$ has multiple variables.)

Compound Interest

- As you get older, you will come to learn a great deal about investing your money...savings accounts, stock market, mutual funds, bonds, etc. Today, we are going to learn about compound interest, which is a form of saving and earning money by letting it sit in an account over time.
- **Compound Interest** is interest earned or paid on both the principal and previously earned interest.
- In middle school, you learned about **simple interest**, which is interest that is only earned on the principal. It's formula is $I = Prt$, where P represents principal, r represents rate, t represents time, and I represents interest.

Compound Interest

$$A = P\left(1 + \frac{r}{n}\right)^{nt}$$

A = balance after t years

P = Principal (original amount)

r = interest rate (as a decimal)

n = number of times interest is compounded per year

t = time (in years)

annually — $n = 1$
Semi-annually — $n = 2$
monthly — $n = 12$
Quarterly — $n = 4$

Example 1

$$A = P \left(1 + \frac{r}{n} \right)^{tn}$$

Example 1: Write a compound interest function that models an investment of \$1000 at a rate of 3% compounded quarterly. Then find the balance after 5 years.

$$P = \underline{1000}$$

$$r = \underline{0.03}$$

$$n = \underline{4}$$

$$t = \underline{5}$$

$$A = 1000 \left(1 + \frac{0.03}{4} \right)^{4 \times 5}$$

$$A = \$1,161.18$$

Example 2

Example 2: Write a compound interest function that models an investment of \$18,000 at a rate of 4.5% compounded annually. Then find the balance after 6 years.

$$P = \underline{18,000}$$

$$r = \underline{0.045}$$

$$n = \underline{1}$$

$$t = \underline{6}$$

$$A = 18000 \left(1 + \frac{0.045}{1} \right)^6$$

$$A = \$23,440.68$$

1
annually = 1

Semi-annually = 2

monthly = 12

Quarterly = 4

Example 3

Example 3: Write a compound interest function that models an investment of \$4,000 at a rate of 2.5% compounded monthly. Then find the balance after 10 years.

$$P = \underline{4000}$$

$$r = \underline{0.025}$$

$$n = \underline{12}$$

$$t = \underline{10}$$

$$A = 4000 \left(1 + \frac{0.025}{12} \right)^{120}$$

$$0.025$$

$$A = \$5,134.77$$

Quick Check - 1

$$y = a(1 \pm r)^t$$

A pot of soup, currently at 84 C is left out to cool. If that temperature decreases by 5% per minute, what will the temperature be in 5 minutes?

$$y = 84(1 - 0.05)^5$$

$$y = 64.99$$

$$y \approx 65C$$

Quick Check - 2

The population of a small town started at 233 people in 1999. If the population grows at a rate of 16% per year, how many people are now in the town in 2006?

$$y = 233(1 + 0.16)^7$$

$$t = 2006 - 1999 = 7$$

$$y = 233(1.16)^7$$

$$y = 658 \text{ people}$$

Growth & Decay Digital Escape Activity

Can you unlock all 5 locks?
You CAN do it!

Type your name, then click NEXT

©2020 Scaffolded Math and Science

The image shows a digital escape activity interface. It features a white brick wall background with a potted tree on the left. Five colorful, glittery padlocks (green, red, blue, yellow, and green) are arranged in a row. A green text box at the bottom contains the instruction 'Type your name, then click NEXT'. The text 'Can you unlock all 5 locks?' and 'You CAN do it!' is displayed in large, bold letters. A small circular icon with three dots is in the top left corner.

Closing:

If there is a % change, the base for growth is $(1+r)$ and for decay is $(1-r)$.

What's going to be the base of the exponential function in the following cases?

$$0.2$$

1. 20% increase

$$1 + 0.2 \\ = 1.2$$

3. 8% increase

$$0.08 \\ 1 + 0.08 = 1.08$$

5. 12.5% increase

$$0.125 \\ 1 + 0.125 \\ = 1.125$$

$$0.15$$

2. 15% decrease

$$1 - 0.15 \\ = 0.85$$

4. 4% decrease

$$0.04 \\ 1 - 0.04 = 0.96$$

6. 42.5% decrease

$$0.425 \\ 1 - 0.425 \\ = 0.575$$
